# Standards And Innovation In Adiuvant Radiotherapy After Breast-conserving Surgery (BCS)

Jürgen Debus
Department Radiation Oncology
University Heidelberg

## Radiotherapy Breast Cancer

CT-based 3D treatment planning

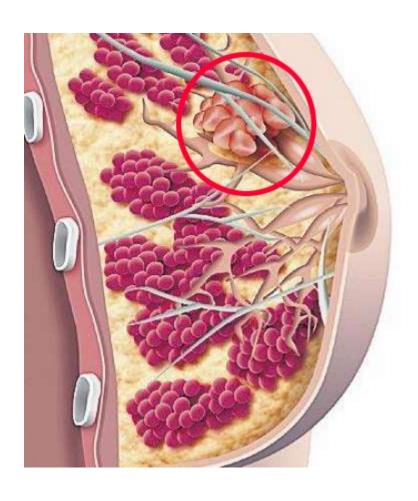

Target volume: whole breast, chest wall

Organs at risk: lung, heart, contralateral breast

<u>Fractionation:</u> dose application in > 30 sessions <u>Aim:</u> to take advantage of DNA-repair in normal cells

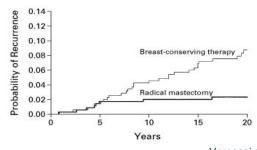

Holland et al., Cancer, 1985:

no residual tumor: 37%

Residual tumor 0-2 cm from PT: 20%
Residual tumor > 2 cm from PT: 43%
Residual tumor > 4 cm from PT: 10%

Sole breast-conserving surgery associated with significantly higher recurrence rates than primary ablation

## Adjuvant Radiotherapy Invasive Cancer

Influence of radiation on local tumor control

Metaanalysis Early Breast Cancer Trialists Collaborative Group (EBCTCG) Loncot 2005; 366: 2087-2106

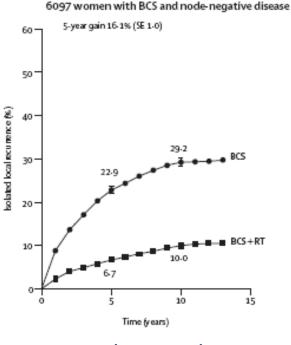

Isolated local recurrence (events/woman-years)

Influence of radiation on local tumor control

Metaanalysis Early Breast Cancer Trialists Collaborative Group (EBCTCG) Longot 2005; 366: 2087-2106

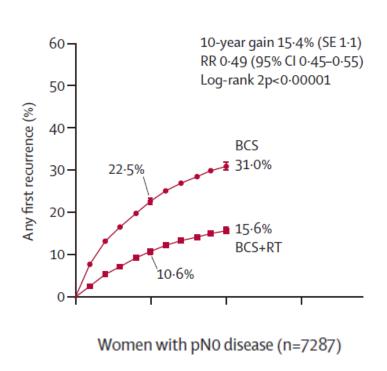

node negative node positive

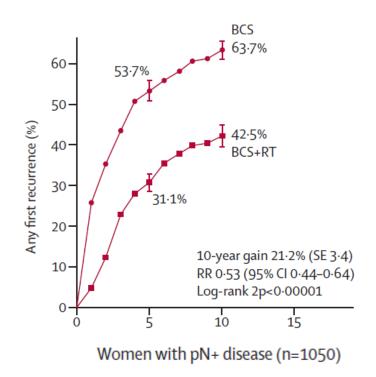

Relative reduction of local recurrence rates of approx. 70%

Influence of radiation on total recurrence rate

Metaanalysis Early Breast Cancer Trialists Collaborative Group (EBCTCG) Lancet 2011; 378: 1707-16

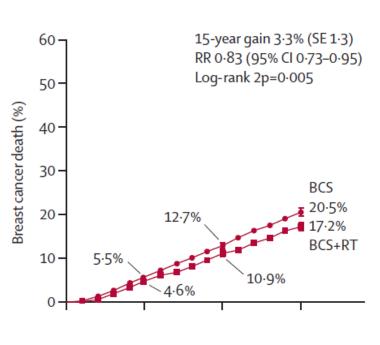

Relative reduction of any recurrence rates of approx. 50%

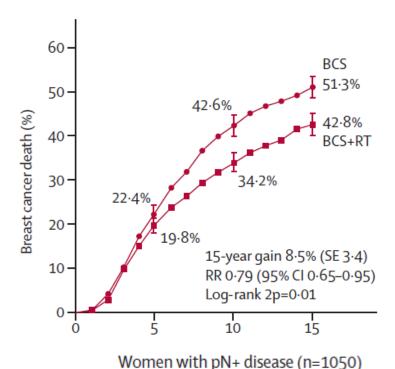

Influence of radiation on mortality

Metaanalysis Early Breast Cancer Trialists Collaborative Group (EBCTCG) Lancet 2011; 378: 1707-16

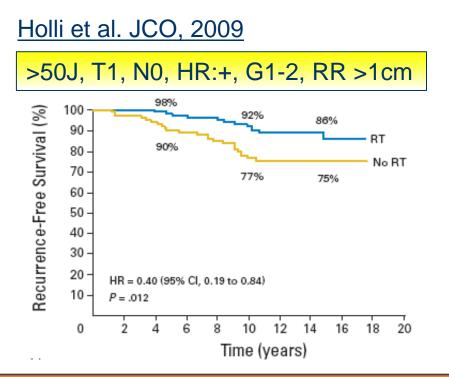

(11-7207) Women With prv. disease (11-1030)

Radiotherapy in BCS improves survival

Are there certain subgroups where adjuvant radiotherapy can be omitted?

Adiuvant RT is standard after BCS even in patients with favorable prognosis!

Can outcome be optimized any further by an additional boost-irradiation of the tumor bed?

Reason: 90% of local recurrences occur in proximity of the primary

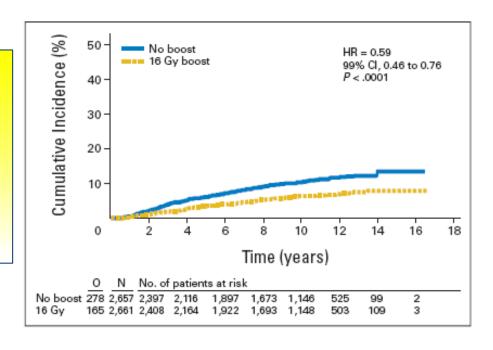

### EORTC Trial, Bartelink et al., 2007:

5318 patients, prospectively randomised

Whole-breast RT (50 Gy)

VS.

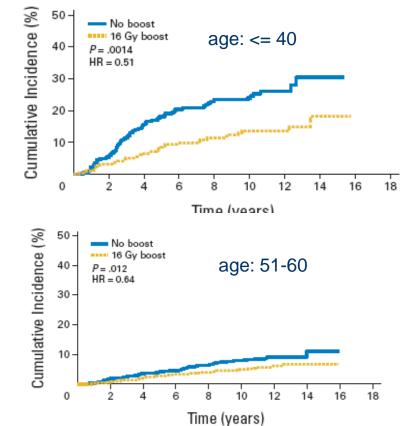

Whole-breast RT + 16 Gy Boost

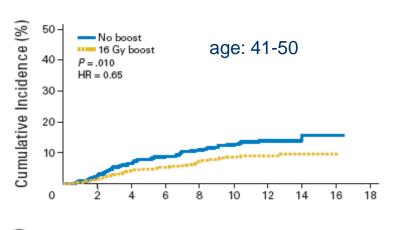

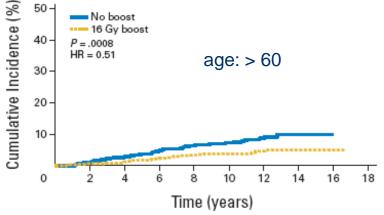

Boost-irradiation of the tumor bed

EORTC Trial, Bartelink et al., 2007:

Boost-irradiation of the tumor bed

Further risk factors for In-Breast-Recurrences:

- •Tumor size >2 cm (T2)
- Close margin (< 3 mm)</li>
- Extensive intraductal component (EIC)
- Lymphangiosis (L1)
- High grade (G3)
- ER/PR-Negativity
- Multifocality

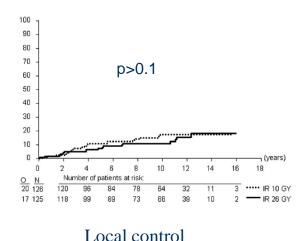

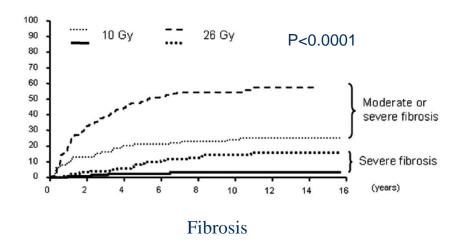

Boost-irradiation of the tumor bed

Can dose escalation of the boost dose compensate for incomplete resections?

Poortmanns et al., Radiother Oncol 2009:

251 patients, T1-2 N0-1, R1-Resection, randomised 10 Gy vs. 26 Gy Boost

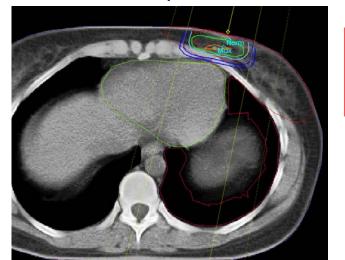

Boost dose escalation does not improve local control after R1-Resection while late toxicity is increased

## Boost-irradiation of the tumor bed after surgery

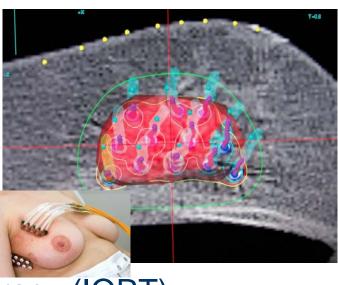

Percutanous 3D-planned radiotherapy

Do we hit the target?

3D-planned brachytherapy

**Electrons** 

Intraoperative radiotherapy (IORT)

**Photons** 

Is adjuvant RT necessary after BCS for DCIS?

### Metaanalysis EBCTCG, 2010:

Journal of the National Cancer Institute Monographs, No. 41, 2010

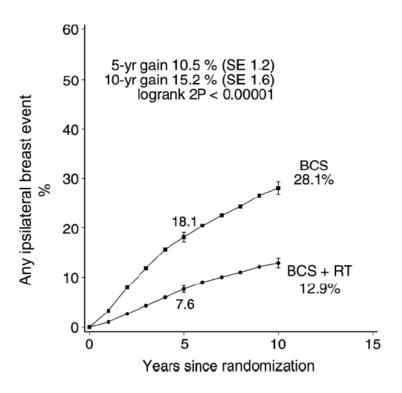

Study	Events/ Allocated BCS + RT	women Allocated BCS		RT events kVariance of O-E	Ratio of anno BCS + RT	ual event rates : BCS

Is adjuvant RT necessary after BCS for DCIS?

### Metaanalysis EBCTCG, 2010:

Journal of the National Cancer Institute Monographs, No. 41, 2010

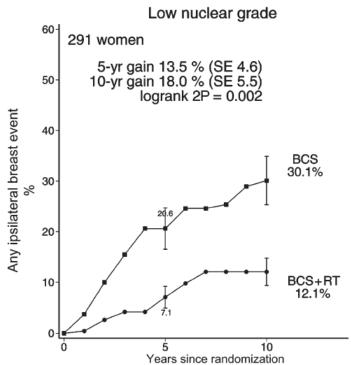

Is adjuvant RT necessary after BCS for DCIS?

### Metaanalysis EBCTCG, 2010:

Journal of the National Cancer Institute Monographs, No. 41, 2010

No identification of subgroups that do not profit with respect to local control!

Is adjuvant RT necessary after BCS for DCIS?

Wong et al., JCO, 2006:

Prospectively randomised study: sole BCS vs. BCS+ adjuvant RT planned patient number: 200

Inclusion criteria:

G1-2

Margins >= 1 cm

Tumor size <= 2,5 cm

Van Nuys Prognostic Index (VNPI) <7

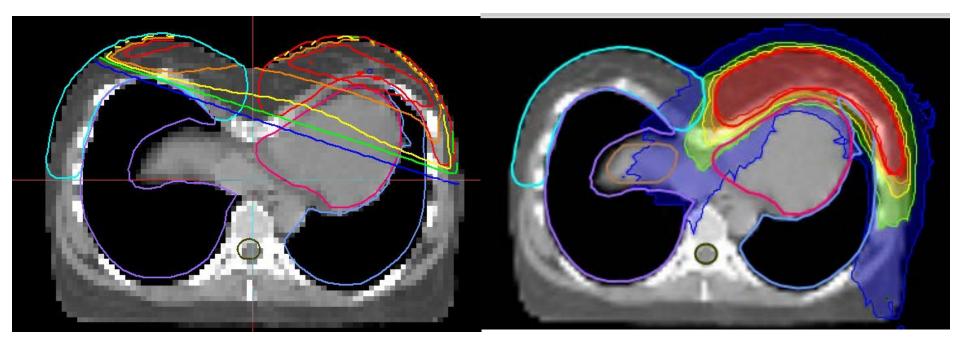

Premature study termination after158 patients because of high recurrence rates!

5-year recurrence rates: approx. 12% (70% DCIS, 30% invasive)

No identification of subgroups without benefit from adjuvant RT!

# Technical Developments: Aim: Better Conformation Of Dose:

Intensity Modulated Radio Therapy (IMRT)

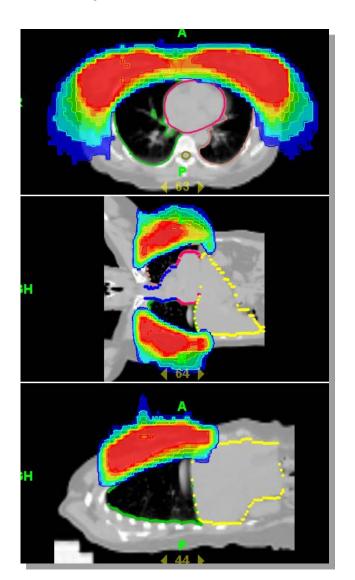

conventional 3D-Plan

**IMRT** 

## Intensity Modulated Radio Therapy (IMRT)

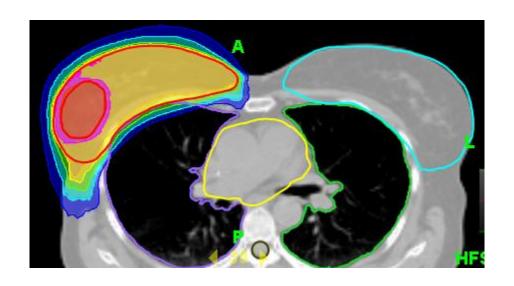

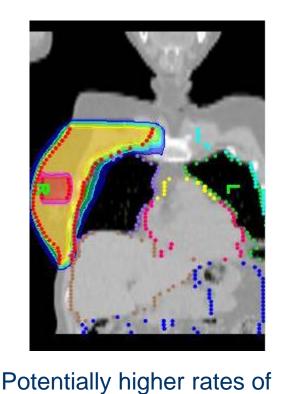

40 y old patient afterbilateral BCS: sparing of lung and heart tissue

## Intensity Modulated Radio Therapy (IMRT)

## **Integrated Boost**

acute and late normal tissue changes by elevated single doses

Shortening of overall treatment time

## **MINT-Trial**

Prospectively randomised, multicentric phase-III study

Hypothesis: no impairment of the outcome despite the shortened treatment

N= 502 patients
Adjuvant RT after BCS

Konv. RT + sequent. Boost

28 + 8 = 36 fractions

**IMRT** + integrated Boost

28 fractions

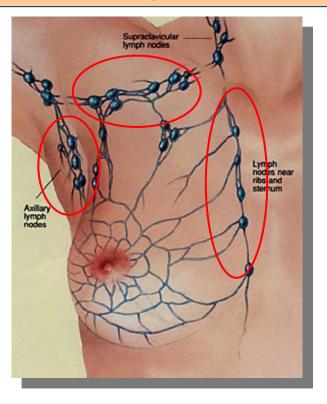

Endpoints: Cosmetics, toxicity and local control

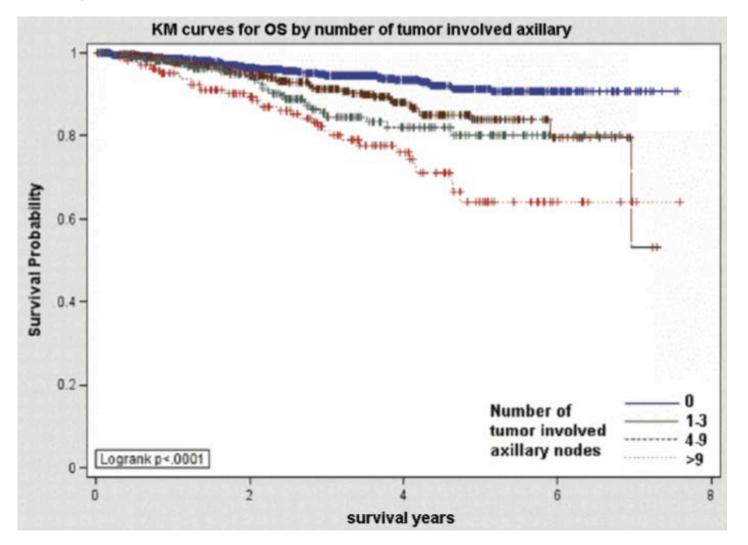

## Adjuvant Radiotherapy Regional Lymphatics

Little evidence by clinical studies on adjuvant RT of the lymphatics to date

Most data result from post-mastectomy trials

# The Impact Of Nodal Status On Survival: Heidelberg Cohort 2003-2009 (N= 3089 all breast cancers)

# Nodal Status Is An Independet Predictor: Heidelberg Cohort 2003-2009 (N= 2723 inv. breast cancers)

DFS DDFS os Univariate Multivariate Univariate Multivariate Univariate Multivariate Age 1.017 1.018 1.01 1.014 1.029 1.036 (0.0288)(<0.0004)(0.0037)(<0.0002)(<0.0001)(<0.0001)pT category 2.105 1.67 2.334 1.882 2.181 1.824 (<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0001)Nodal status 1.655 1.354 1.723 1.368 1.59 1.355 (<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0001)Grading 2.502 1.673 2.701 1.759 3.215 1.804 (<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0003)HR status 0.376 0.421 0.383 0.410 0.27 0.262 (<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0001)(<0.0001)HER2 status 2.27 1.05 2.117 0.968 2.348 0.822 < 0.0001)(0.7811)(<0.0001)(0.8586) (<0.0001) (0.3988)

DFS, disease-free survival; DDFS, distant disease-free survival; OS, overall survival; HER2, human epidermal growth factor receptor 2; HR, hormone receptor.

## Adjuvant Radiotherapy Axillary Lymphatics

Is additional therapy of the axilla mandatory in positive sentinel node?

Tjan-Heijnen, ASTRO abstract 2009:

retrospective, 2592 pat., no macro mets, only pN0(i-), pN0(i+) or pN1mi

Treatment: SN only or completion ALND or axillary RT

n 5-year AR(%) HR AR (95%CI)*	n 5-	year AR	(%) HR	AR	(95%CI)	*
-------------------------------	------	---------	--------	----	---------	---

pN0(i-)(sn) cALND	113	1.9	1.00
pN0(i-)(sn) SN	722	2.2	1.07 (0.23 - 4.94)
pN0(i+)(sn) cALND or ax RT	459	1.1	1.00
pN0(i+)(sn) SN	340	1.7	2.14 (0.57 - 7.96)
pN1mi(sn) cALND or ax RT	828	1.2	1.00
pN1mi(sn) SN	130	6.2	4.45 (1.46 - 13.54)

Significantly higher axillary recurrence rate in pN1mi when no further treatment (surgery or RT) is performed

## Adjuvant Radiotherapy Axillary Lymphatics

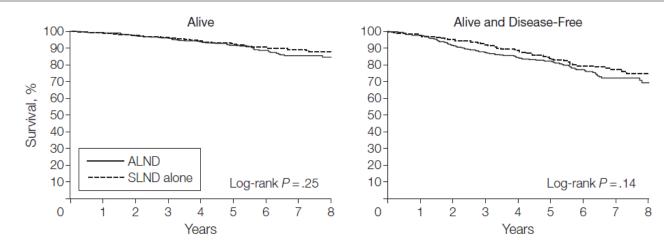

Is additional therapy of the axilla mandatory after positive SLND?

Giuliano et al., JAMA 2011: ACOSOG Z0011 trial

randomized, closed prematurely: 856 of 1900 planned patients T1-2, cN0, sentinel node biopsy positive (1-2 SNB+)

Treatment: BCS, adjuvant tangential RT (breast only, not axilla)

Randomisation: completion ALND vs. no further dissection

## Adjuvant Radiotherapy Axillary Lymphatics

Is additional therapy of the axilla mandatory after positive SLND?

Giuliano et al., JAMA 2011: ACOSOG Z0011 trial

Conclusion: "in patients with limited positive SLN disease, treated with breast conservation +/- systemic therapy, the use of SLND alone compared with ALND did not result in inferior survival"

### **But:**

- Study not powered for the limited patient number
- Primary endpoint overall survival, not locoregional recurrence
- Short follow-up (median 6.3 y) for detection of survival differences
- Radiotherapy not further specified, espec. concerning inclusion of axilla

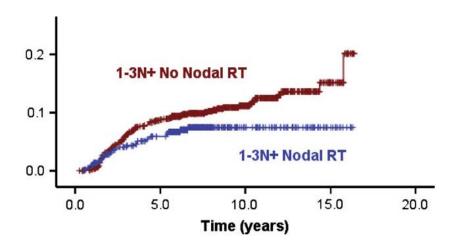

Results should be interpreted very carefully

## Adjuvant Radiotherapy Supraclavicular Lymphatics

Irradiation of the supraclavicular lymphatics even in less than 4 affected axillary nodes?

Truong et al. 2009: retrospective, 5699 Pat., T1/2, N0-1a, M0

1-3 pos. ax. LN: age<50 or G3 or ER-neg.: locoregional recurrence risk 15-20 %

significant reduction of regional recurrence by supraclavicular RT

## Adjuvant Radiotherapy Supraclavicular Lymphatics

Irradiation of the supraclavicular lymphatics even in less than 4 affected axillary nodes?

Whelan, ASCO Abstract 2011: Intergroup / NCIC-CTG MA.20 trial

Prospective, multicenter, 1832 pts., high-risk N0 (10%) or N+ (85% N1a)

Whole-breast RT (50 Gy)

Whole-breast RT (50 Gy)

+

regional nodal RT

(SCLV/internal mammary/axillary apex) (45 Gy)

### Impact of WBI+RNI on:

- isolated locoregional 5-yr DFS: 96.8% vs 94.5% (SS)
- distant DFS: 92.4% vs 87.0% (SS)
- DFS: 89.7% vs 84.0% (SS)
- OS: 92.3% vs 90.7% (trend p=0.07)

## Summary

Invasive carcinoma: Adjuvant RT improves local control and overall survival

further improvement of local control by Boost-RT

• <u>In-situ carcinoma</u>: Adjuvant RT after BCS improves local control

no identification of subgroups not profiting to date

IMRT: improved dose conformality and normal tissue sparing

possibility of integrated boost concept

Regional lymphatics: SLN+: omission of cALND only in selected cases

1-3N+: RT of supraclavicular lymphatics (G3,<50y,ER/PR -)

4-N+: supraclavicular RT generally recommended
